Andrés Araque

AGENTIC / AI ENGINEERING

Orlando, FL · pipe.araque@gmail.com · github.com/seeko-codes

I build ambitious, polished products with agentic development systems. I design the context, tools, and verification loops that let agents deliver at speed, and the stateful architectures that make AI products useful.

EXPERIENCE

Donna | Founding development team — iOS app on the App Store

• Build UI and backend logic for a social app connecting people at UCF. View app.

• Lead the current refactor toward an architecture agents can navigate and extend, with the tools and context needed to make correct changes.

SELECTED PROJECTS

Hacky | AI matchmaking for hackathons — ~32-hour build window · team of 3

• Directed agentic development of the product prototype, React interface, and conversational onboarding at Knight Hacks IX. Paired a focused interaction model with a custom knit mascot and carefully paced matching cards. Live demo · Source.

Étude | Adaptive piano tutor and rhythm game — Gator Hack V finalist · ~44 hours

• Owned the entire learning architecture: a 207-skill graph, diagnostic, Bayesian mastery updates, and spaced review. Built a constrained AI planner that uses learner evidence and goals to choose the next practice session, with runtime validation and deterministic fallback.

• Delivered the learning system through focused Claude Code worker sessions, durable context, separate PRs, browser verification, and CI. Part of a three-person team building a tutor and rhythm game for a real piano. Source.

Ultralearn | AI-guided learning — Currently building

• Building a desktop app for SAT math: diagnose what a learner knows, map it to a skill graph, and prepare the next useful step. Living ink becomes the interface. @ultralearns.

AGENTIC ENGINEERING

• **Orchestration and context:** Claude Code, Codex, focused parallel workers, isolated Git worktrees, repository architecture, durable specs, skills, hooks, and handoffs.

• **Quality and improvement:** browser verification, tests, CI gates, and feedback loops that improve the tools and instructions agents use between runs.

• **Reusable tooling:** authored Turn to Life and Skemify; maintain seeko-stack, a portable distribution of Kun Chen's Firstmate ecosystem.

Product stack: TypeScript, React, Next.js, Vite, Electron, Python, PostgreSQL, Playwright, Vitest.

EDUCATION & TEACHING

University of Central Florida | B.S. Mathematics — Expected 2027

Relevant coursework: AI & Machine Learning; Optimization Theory & Mathematical Modeling; Linear Algebra.

A3 Tutors · Founder & SAT Tutor · 2024-present. Coach students toward SAT goals and Bright Futures eligibility. Previously tutored mathematics at Mathnasium.

Hackathon times are elapsed repository build windows, rounded; team outcomes reflect shared work.
